DO NOW

Recommended

- SOC — Time-box 203.0.113.10; monitor 429s
- INTEL — Enrich 3 critical targets in case mgmt
- APPSEC — Investigate behavioral-anomaly cohort — Traffic cohort Browser

ANALYST ASSESSMENT · HIGH CONFIDENCE

CRITICAL

Analyst Assessment

Assessed with high confidence: this window is consistent with a targeted high-volume incident against `/login/*` on www.example.com, with credential-abuse as an investigation lead rather than a confirmed finding. A separately corroborating signal appears in the Browser-cohort behavioral anomaly. This is not a broad traffic shift.

Four independent signals concur:

- Spike flags `volume_up`, `rate_429_up`, and `bot_share_up` all fired against the trailing window.
- Three client IPs (`203.0.113.10`, `198.51.100.42`, `192.0.2.17`) reached `severity: critical` — they share ASN `64500`, concentrate on a single path, and carry both high volume share and a high 429 rate within their target traffic. ASN `64500` itself and User Agent `python-requests/2.31` sit at `severity: high` alongside them.
- SIEM `block-credential-stuff` policy delta is +520% vs baseline, with `rate-limit-login` at +610%; treat this as a lead that still needs auth endpoint, failure pattern, account/user identifier, or SIEM/auth correlation before calling credential stuffing confirmed.
- The Traffic cohort `Browser` graduated on the `anomaly` primitive: its current-window error rate of 13.7% is 26× its baseline (~0.5%). This is consistent with sophisticated automation passing bot-classification — the kind of pattern that needs application-layer validation, not just WAF rules tuned for the named IP cluster.

The 4.25M-request / 8.2% 429-rate Impact tiles are consistent with the primary read; the reasons to escalate are the named single-ASN cluster, the automation UA matches, *and* the Browser-cohort behavioral departure — not the raw volume.

429s served: 8.20% of window

46.75K
5xx served: 1.10% of window

PRIMARY CONCERN

EVIDENCE BOUNDED

Primary concern: anomalous Human-classified traffic

Browser traffic was classified as human-like but flagged at high severity by behavioral evidence.

SIGNAL 1
28.6% of window requests

SIGNAL 2
39.7% 429 rate within target traffic

SIGNAL 3
Reason flags: behavioral anomaly

FINDINGS

Evidence-backed findings

Findings are generated from deterministic suspicious-target evidence.

Finding 01 · Finding 01

CRITICAL CLIENT IP CLIENT IP

Critical-tier client IPs coordinated against this window.

These IPs drove ~31% of window traffic and crossed the multi-signal heuristic ladder (volume + 429 rate within target traffic + single-path concentration):

203.0.113.10 CRITICAL
Client IP
12.7% of window share

198.51.100.42 CRITICAL
Client IP
9.90% of window share

192.0.2.17 CRITICAL
Client IP
8.50% of window share

Finding 02 · Finding 02

HIGH USER AGENT USER AGENT

Automation tooling declared in the user agent.

These user agents account for ~31% of traffic and match curated automation patterns (automation user agent, high 429 rate, high volume share). The report does not infer intent from the identifier — the names below are what the requests presented:

python-requests/2.31 21.6% of window
User Agent

curl/7.88.1 9.60% of window
User Agent

Finding 03 · Finding 03

HIGH

Human-classified behavioral anomaly needs validation.

`Browser` shows a behavioral departure from the baseline. Treat this as a likely classification mismatch or behavioral anomaly until route owners and application telemetry confirm the cause; it is not proof of malicious intent.

RECOMMENDED ACTIONS

What to do next

Actions are candidates with scope, duration, validation, and rollback criteria.

01 NOW Target: Client IP `203.0.113.10` · Duration: 24h · Rollback: Rollback if protected traffic errors rise, owner validation fails, or pressure shifts to adjacent legitimate traffic.

Time-boxed edge control candidate: Client IP `203.0.113.10`

Why this recommendation exists: Critical severity; 12.7% request share; 26.4% 429 rate within target traffic; rate-limit pressure.

02 TODAY Target: Critical action targets · Duration: Same shift · Rollback: None; update case status if later evidence downgrades the target.

Enrich the 3 critical target(s) in case management — `203.0.113.10`, `198.51.100.42`, `192.0.2.17`

Why this recommendation exists: 3 target(s); 3 Critical; combined 31% request share; rate-limit pressure.

03 THIS WEEK Target: Behavioral-anomaly targets · Duration: Investigation window · Rollback: Close as benign if owner/source validation explains the pattern.

Investigate behavioral-anomaly cohort — Traffic cohort `Browser`

Why this recommendation exists: 1 target(s); 1 High; combined 29% request share; behavioral anomaly.

04 NOW Target: Incident dashboard · Duration: During active triage · Rollback: Do not use dashboard-only observations to override artifact metrics without recapture.

Continue investigating in the linked Grafana dashboard (pre-scoped to the incident window)

Why this recommendation exists: dashboard handoff preserves the report scope filters and incident window.

05 THIS WEEK Target: Detection and response coverage · Duration: Post-incident · Rollback: N/A.

Schedule retrospective — review SIEM coverage on affected endpoints

Why this recommendation exists: observed edge action and flagged-target evidence can diverge after an incident.

ATTACK SHAPE

How the pressure presented

Traffic shape is derived from deterministic window evidence.

14:00	14:13	14:23	14:47 UTC	16:07	17:00
DETECTED START	RAMP BEGINS	FIRST CREST	HIGHEST PRESSURE	SUSTAINED TAIL	WINDOW CLOSE
Anomaly window opens.	Traffic crosses the material elevation threshold.	6.2K requests observed in the bucket.	Peak bucket reaches 6.5K requests.	Elevated traffic remains present after the peak.	Evidence window closes.

WHERE THEY AIMED

Top paths by request share

/login/*	2.90M	68.2%
/api/v1/auth/*	720.00K	16.9%
/	230.00K	5.40%
/static/*	180.00K	4.20%
/checkout/*	65.00K	1.50%

ATT&CK / METHODOLOGY

Technique mapping and method

Mappings are deterministic labels from observed behavior.

T1498 IMPACT

Network Denial of Service

observed-consistent: Critical Client IP `203.0.113.10` matched shared ASN, path concentration, high volume evidence.

T1110 CREDENTIAL ACCESS

Brute Force

possible investigation lead: Possible investigation lead only. Observed signal: Critical Client IP `203.0.113.10` matched shared ASN, path concentration, high volume evidence. Requires auth-specific telemetry: auth endpoint, failure pattern, account/user identifiers, or SIEM/auth correlation.

T1071.001 COMMAND AND CONTROL

Application Layer Protocol: Web Protocols

observed-consistent: High User Agent `python-requests/2.31` matched high volume, automation UA evidence.

T1110.004 CREDENTIAL ACCESS

Credential Stuffing

possible investigation lead: Possible investigation lead only. Observed signal: Critical Client IP `203.0.113.10` matched shared ASN, path concentration, high volume evidence. Requires auth-specific telemetry: auth endpoint, failure pattern, account/user identifiers, or SIEM/auth correlation.

T1583.003 RESOURCE DEVELOPMENT

Acquire Infrastructure: Virtual Private Server

observed-consistent: Critical Client IP `203.0.113.10` matched shared ASN, path concentration, high volume evidence.

T1036 DEFENSE EVASION

Masquerading

observed-consistent: High Traffic cohort `Browser` matched behavioral anomaly evidence.

METHODOLOGY

This report is presentation-only. Metrics, ranks, evidence limits, and scores come from deterministic incident artifacts. Credential ATT&CK mappings require auth-specific corroboration before being treated as findings.

ANALYSIS AVAILABILITY LIMITATIONS

What the bundled artifacts can and cannot support

Availability notes prevent unsupported conclusions. Unavailable rows are limitations, not negative findings.

ASN / HOSTING DECOMPOSITION PARTIAL

Observed ASN ranking is present, but the bundled artifacts do not include hosting-provider taxonomy beyond optional AS reputation context.

BASELINE-RELATIVE ACTOR EMERGENCE AVAILABLE

1 flagged target(s) carried new-in-window or high-volume-new-actor evidence.

EDGE-ACTION EFFECTIVENESS UNAVAILABLE

No edge action mix was bundled.

FLAGGED-IP CLUSTERING UNAVAILABLE

No explicit flagged-IP cluster artifact was bundled.

PROTECTED-POPULATION / COUNTERFACTUAL CHECK UNAVAILABLE

The bundled artifacts cannot evaluate collateral impact or counterfactual outcomes.

BROWSER UA AGE

Age context for flagged browser user agents

Browser age is context only. Older UA tokens are consistent with intentionally configured, pinned, spoofed, or non-updating clients; they are not proof of operator intent or classification bypass.

185 local release rows; 18 month stale threshold as of 2026-05-13.
